

JUNI YADI

Surabaya, Indonesia • juniyadi94@gmail.com • +6285708296482

SUMMARY

Lead DevOps Engineer with 5+ years of experience operating and scaling AWS and Kubernetes production platforms for high-availability applications. Experienced in leading production incident response, on-call operations, observability, infrastructure automation, and cloud cost optimization. Proven track record of reducing AWS infrastructure costs from USD 35,000 to USD 5,000 while improving deployment speed by 75% and maintaining MTTR below 10 minutes. Strong expertise in AWS EKS, Kubernetes troubleshooting, Terraform, GitOps, Grafana, Prometheus, Linux, Bash/Python automation, and building reliable, secure, and scalable production infrastructure. Passionate about improving platform reliability, developer experience, and operational excellence through automation, monitoring, and continuous optimization.

PROFESSIONAL EXPERIENCE

Lead DevOps Engineer

Aug 2024 - Present

PT. Pintar Pemenang Asia, Jakarta, Indonesia

- Owned the reliability, scalability, and day-to-day operations of AWS EKS production platforms supporting 20+ microservices, ensuring high availability, operational stability, and efficient resource utilization.
- Led production incident response from initial triage through recovery, performing hands-on troubleshooting across Kubernetes, networking, infrastructure, and application layers while maintaining an MTTR below 10 minutes.
- Participated in production on-call rotations, responding to customer-facing incidents during weekends and after-hours while coordinating closely with engineering teams to restore services quickly.
- Enhanced the production observability platform using Grafana, Prometheus, Elastic APM, EFK, CloudWatch, and uptime monitoring to improve incident detection, production visibility, and troubleshooting efficiency.
- Reduced monthly outbound bandwidth consumption from approximately 100 TB to 30 TB by optimizing EC2 allocation strategies, traffic routing, and workload placement while maintaining application performance.
- Standardized Infrastructure as Code using Terraform and CloudFormation while implementing GitOps deployment workflows with ArgoCD and GitHub Actions, reducing deployment time from 20 minutes to 5 minutes (75% faster).
- Improved deployment reliability by partnering with software engineers on release strategies, rollback procedures, deployment automation, and production readiness across multiple services.
- Managed AWS EKS production clusters, troubleshooting pod failures, networking issues, ingress configuration, autoscaling behaviour, node resource constraints, and service availability.
- Strengthened production security by implementing HashiCorp Vault, IAM least-privilege policies, Trivy container image scanning, and infrastructure hardening across Kubernetes, EC2, and Linux environments.
- Automated operational workflows using Bash and Python, reducing repetitive engineering tasks and improving operational efficiency.
- Led two DevOps engineers through technical mentoring, infrastructure documentation, runbook creation, knowledge-sharing sessions, and technical interviews.

DevOps Engineer

Aug 2022 - Aug 2024

PT. Pintar Pemenang Asia, Jakarta, Indonesia

- Modernized the company's cloud platform by transforming legacy infrastructure into a scalable, observable, and cost-efficient AWS environment supporting business-critical production workloads.
- Reduced monthly cloud spend from USD 35,000 to USD 5,000 (~86%) within six months by rightsizing Amazon EKS and EC2 workloads, implementing Spot/On-Demand capacity strategies, optimizing storage, and establishing continuous cloud cost monitoring.
- Transformed a limited-observability production environment into a fully monitored platform by implementing Grafana, Prometheus, Elastic APM, EFK, CloudWatch, and uptime monitoring, significantly improving production visibility, incident detection, and troubleshooting efficiency.
- Designed and implemented Infrastructure as Code using Terraform, CloudFormation, and Ansible, improving infrastructure consistency, deployment reliability, and disaster recovery readiness.

- Built GitOps deployment pipelines using ArgoCD, Helm, and GitHub Actions, replacing manual deployments while improving deployment speed, consistency, and rollback capability.
- Designed and operated AWS EKS production clusters, implementing autoscaling, high availability, workload optimization, and Kubernetes operational best practices.
- Investigated production performance issues using infrastructure metrics, Elastic APM traces, PostgreSQL analysis, centralized logs, and Kubernetes telemetry to identify bottlenecks and improve platform reliability.
- Developed internal engineering tools using AWS Lambda, API Gateway, SNS, Python, and TypeScript to automate operational workflows and monitor AWS SES bounce and complaint events.
- Implemented production security improvements using Teleport, HashiCorp Vault, IAM, Trivy, and infrastructure hardening across cloud environments.
- Designed and deployed a highly available Jitsi conferencing platform for the Prakerja Program while reducing recording storage costs by 50%.
- Implemented Ansible automation for Elasticsearch clustering and standardized infrastructure provisioning across AWS and on-premises production environments.

DevOps Engineer

Jul 2021 - Aug 2022

PT. Aku Cinta Memiles, Jakarta, Indonesia

- Built and managed scalable AWS infrastructure for production environments, improving system reliability.
- Migrated a traditional database to AWS, ensuring high availability and scalability to handle thousands of users during promotional events.
- Configured and optimized Nginx servers for Laravel and Next.js applications, improving response times and resource efficiency.
- Implemented Redis as a caching layer, significantly reducing database load and improving system performance.
- Migrated system from a single-instance to a multi-instance architecture, resolving I/O bottlenecks and increasing resilience.
- Designed and deployed a CI/CD pipeline using GitHub Actions, automating deployments across all existing repositories.
- Automated infrastructure provisioning using Ansible, reducing manual setup time and improving consistency.
- Managed RDS databases with automated backups, monitoring, and performance optimization.
- Performed safe database migrations, ensuring schema updates were executed securely through version-controlled repositories.
- Upgraded system notifications using AWS SES, enhancing email reliability and reducing delivery failures.
- Conducted frequent system updates and vulnerability scans, strengthening security and reducing risks.

Backend Development and Cloud/Serverless Architecture

May 2019 - Jul 2021

Pojokan Projects, Indonesia (Remote)

- Developed and maintained robust, cost-efficient serverless backend systems primarily using Node.js and TypeScript (alongside PHP), leveraging AWS Lambda, API Gateway, and DynamoDB for high scalability.
- Optimized serverless architectures to reduce costs during idle periods while maintaining high availability for applications in hospital surveys, education platforms, and restaurant management systems.
- Designed and implemented CI/CD pipelines using GitHub Actions, automating deployments for seamless application updates.
- Built and integrated AWS Chime to enable reliable and scalable online communication features.
- Managed and optimized Amazon S3 object storage for faster access and cost reduction.
- Utilized Serverless Framework to manage and maintain AWS Lambda functions and associated resources, ensuring efficient IAM policy attachments.
- Designed and implemented DNS management solutions using Amazon Route 53 and Cloudflare, ensuring high availability and low latency.
- Implemented secure authentication and authorization mechanisms using OAuth2, JWT, and AWS IAM, ensuring robust access control.
- Collaborated with cross-functional teams to deliver high-quality software solutions, including front-end engineers, product managers, and designers.

EDUCATION

Bachelor of Science of Informatics Engineering (In Progress)

Jun 2022 - Present

University Widya Kartika, Surabaya, Indonesia

Pursuing a Bachelor's degree while working full-time as a Lead DevOps Engineer, balancing academic studies with hands-on experience in cloud infrastructure, Kubernetes, and production operations.

SKILLS

Cloud Platforms: AWS (EKS, EC2, VPC, IAM, ALB/NLB, Auto Scaling, CloudFormation, Lambda, API Gateway, Route53, CloudFront, RDS, DynamoDB, S3, SNS, SQS, EventBridge, CloudWatch, Systems Manager, Secrets Manager), Container Platforms: Kubernetes, Amazon EKS, Docker, Helm, Istio, Podman, Infrastructure as Code: Terraform, CloudFormation, Ansible, Pulumi, GitOps & CI/CD: GitHub Actions, ArgoCD, Jenkins, Observability: Grafana, Prometheus, Elastic APM, EFK Stack (Elasticsearch, Fluent Bit, Kibana), CloudWatch, Datadog, Security: HashiCorp Vault, IAM, Trivy, Teleport, Databases & Messaging: PostgreSQL, MySQL, MongoDB, Redis, RabbitMQ, OpenSearch, Networking: Nginx, HAProxy, AWS VPC, CloudFront, Route53, Programming: Python, Bash, JavaScript, TypeScript, Operating Systems: Linux, Practices: Production Operations, Incident Response, On-call Support, Infrastructure Automation, Cost Optimization, High Availability, Autoscaling, Disaster Recovery, Performance Optimization, Microservices

PROJECTS

Internal Engineering Platform

Technologies: Github Actions, Python, Bash, AWS, Terraform, Docker, Kubernetes

Designed and developed internal engineering platforms supporting deployment automation, infrastructure operations, cloud management, observability, and developer productivity. Built reusable automation tools using GitHub Actions, Python, Bash, and AWS services to reduce manual operational effort and improve engineering efficiency.

Pulumi Easy

Live Project | Github Link

Technologies: Python, Pulumi, AWS

Designed and developed internal engineering platforms supporting deployment automation, infrastructure operations, cloud management, observability, and developer productivity. Built reusable automation tools using GitHub Actions, Python, Bash, and AWS services to reduce manual operational effort and improve engineering efficiency.

SES Complaint & Bounces

Technologies: NodeJS, AWS Lambda, Serverless Framework, AWS SES, AWS API Gateway, AWS DynamoDB, AWS SNS

Designed and developed a serverless AWS event-processing platform that tracks SES bounces and complaints in real time using AWS Lambda, API Gateway, SNS, DynamoDB, and Serverless Framework, providing engineering teams with actionable email delivery insights and operational visibility.

CERTIFICATES & AWARDS

AWS Certified Cloud Practitioner — Apr 2024

AWS Certified SysOps Administrator – Associate — Nov 2022

AWS Academy Graduate - AWS Academy Cloud Operations — Oct 2022

LANGUAGES

Indonesian — Native or Bilingual Proficiency

English — Professional Working Proficiency
